Save Money with the Use of a Bulk Ink System

by Julia Bennet

Article published on February 1st 2012 | Computer

Not all printer ink cartridges are the same. In most cases if you want to acquire high quality ink for your computerâ€™s printer you will have to purchase specific ink cartridges from the manufacturer of your current printer. When making use of generic printer cartridges you could end up losing quality in ink. This can result in poor paper and photo printings. That is why most people simply fork over their hard earned cash to acquire name brand replacement cartridges for their printer.

At one time inkjet refill kits were all the rage. These are kits that feature tubes of ink. A device that resembles a needle is used to transfer the ink directly to your used printer cartridges. The problem with these types of kits is that the process of transferring ink from the vials to the cartridges can be quite messy. Additionally, the process is quite time consuming. Most people simply donâ€™t have the time to waste in this transfer process and simply want to avoid the mess involved.

The reason why this option was so popular when it was introduced into the market is due to the low cost of the refill kits. However, once users began to realize how time consuming it was they quickly decided that the savings wasnâ€™t worth their time. Therefore, they relied on purchasing full priced new cartridges for their printer.

Another thing that users encountered when they began using these refill kits is that the ink provided produced less than superior printings. In fact, most users of these refill kits were quick to judge and compare the quality between the kits and actual new cartridge ink printings. Due to the significant decrease in quality most people simply put aside this option altogether. This is specifically true of people who print up high quality photographs with their printer.

If you were looking for an alternative for replacing ink in your printers and were running a business this refill kit option would simply not have worked at all due to the lengthy process involved in the replacement and transfer of ink.

However, there is an easy solution and option available to those who wish to save money on replacement ink without having to skimp on quality and without having to waste their time and effort. This is the use of a bulk ink system like Inklink. This is a continuous ink system that is very simple to get started using.

A bulk ink system is a device that is placed next to your printer. The continuous ink system contains ink for your printer. Tubes run from the bulk ink system to your printer and are attached to your ink cartridge. When your printer is printing the continuous ink system will determine if ink is needed and will transfer it to your cartridge.

The bulk ink system only takes a few minutes to put into place. The bulk ink system also provides a steady and long lasting stream of ink to your printer. Those companies and individuals who have made use of the continuous ink system report getting two to three times more ink from the continuous ink system than they do from a single replacement ink cartridge.
