Dental Bridge is also named as Fixed Partial denture and comes under a division of dentistry called as Prosthodontics. The main role of the dental bridge is to block up the space in teeth caused because of the lost of one tooth or more. A bridge is formed of two caps for the teeth on both area of the space and the space itself is packed by an artificial teeth/tooth.

The two teeth on both the side of the artificial play a role which is called as join teeth. In dental terms false teeth is named as pontics. These pontics are prepared by the materials such as alloys, porcelain, gold or with the mixture of all these substances. Dental bridges need compulsory hold up with the support of implants or by natural teeth.

Benefits Of Dental Bridges:

There are various benefits of dental bridges you can take of. The most important benefit of dental bridges is that you can bring back your smile and personality as well. You will also feel happy and comfortable because when you lost even one tooth or more, it becomes hard for daily actions like speaking or eating. By dental bridges this difficulty can easily be seek out.

Kinds Of Bridges:

Mainly, there are three kinds of bridges such as Traditional, Cantilever and Maryland bonded bridge. Traditional bridge is one of the most popular amongst all bridges. It is produced with porcelain, which is generally combined with any ceramics or metal.

Cantilever, it is also one of the important bridges; these types of bridges are utilized in exceptional cases only. These types are used when there is the existence of adjoining teeth on single part of the lost teeth or tooth.

Lastly, the Maryland bonded bridges are also called as resin-bonded bridge. This type of bridge is prepared by plastic gums and teeth and is maintained by metal support. There are metal sections on both side of the bridge which create a connection with present teeth for its accurate joining with the opening.

Procedure Of Dental Bridge:

If you need to get a Fixed Partial denture, then you need to make appointments to the clinic. At the first visit only diagnosis and normal review will be done to ensure that Fixed Partial denture is the correct treatment. Then the juncture teeth are made according to your need of bite. An exact part of the enamel is detached so that cap can be set on the teeth. After that imitation of the teeth are in use, in order to used as a model producing of pontic, bridges and caps in the laboratory. Then you dentist will give you impermanent bridge from the security of uncovered teeth and gums for few days.

After few days the impermanent bridge will be taken out and new bridge will be placed permanently. Permanent bridge will take 2 weeks approximately to get fixed. And then it can work without any help.
