We all take the sun for granted because it is there for us every day. But as this article explains, we can enjoy a lot more than just its warmth and brightness. How do you make use of it?

There are lots of different ways to plug into energy sources. For example you can put a plug into a wall socket to turn on a light or to use a kitchen appliance. But you might be surprised at the number of ways you can use solar power to do various things in your life.

Some of these methods are already known. Perhaps one of the most commonly seen things on a larger scale is a solar panel. These panels adorn the roofs of many houses and buildings all over the world. They provide energy to power various functions within the buildings, helping to reduce the energy bills at the same time.

But there are lots of other ways to make the most of solar energy too. On a smaller scale we are all familiar with solar powered calculators. We also use other items that are solar powered that provide a good insight into how this power can be used. But not everyone is familiar with the full range of items that are available.

Take a solar battery charger for example. This is a very useful item that enables you to charge your batteries using power from the sun. You have to use proper rechargeable batteries for this, but all you do is pop them into the charger. You then make sure the solar battery charger is in full view of the sun and wait for the batteries to charge. No need to plug the charger into your computer via a USB cable and no need to plug it into the mains to charge them that way. It couldnâ€™t be easier to do and it is fully portable too, which is another bonus.

But what about other more unusual things you could do with solar power? For example if you think about cooking outdoors you would normally think of a barbecue, either gas powered or using charcoal. But what if there was another way to cook something, simply by using the power of the sun? Would you try it out?

Most people would, simply to be able to experiment with this method. If you like going camping you will certainly be advised to consider buying a sun oven. This oven works simply by using the sunâ€™s power to heat and cook the food you put inside. It is said that anything you can prepare in a normal oven can also be successfully prepared and cooked in this oven. This is quite a claim to make, and it just goes to show how effective a sun oven can be, simply by adding the sunâ€™s rays to complete the cooking process.

So if you want to be eco-friendly, think about how you can take advantage of using the sun to power various things.
