Make Your Aquarium Fancy with Aquarium LED Lighting by DJ Willis

Article published on February 27th 2012 | Home

Different people keep aquariums for a variety of reasons. Whether you like having fish as pets or whether you think of your aquarium as an attractive addition for your room, you may want to add some additional features in your tank.

A bit of driftwood may add visual interest and charm to your tank. Before you drop the first piece of wood you find in your tank though, seek advice from your local fish store and ensure you will get a piece that won't cause damage to your tank or to your fish. New wood pieces should be measured in a quarantine tank to make sure the piece is safe for your tank.

Aquarium ornaments can add a cute or original spin on your tank, such as the Reefkeeper elite. Lots of options can be found including divers, bridges, columns, or sunken ships. Pick something which looks nice in the overall design of your tank and also the colors of the fish.

Enhance the lighting inside your tank using aquarium led lighting. Before you add or take away any light, check with the local fish store to ensure that you get the right lighting for the fish and coral that you have living in your tank. Adding a light that simulates lunar light is a cool and realistic option for a fish tank.

With respect to the shape of your tank, consider the positioning of the elements of your tank. Think about aspects of design when you work on setting up rocks, plants, or other objects. Utilize a number of heights and angles to add interest in the space.

Many fish need substrate to be able to dig and hide in. It can also provide a useful place for bacteria to cultivate. Some options include quarts, granite, or fine sand. Although some silt may appear in the tank when you initially introduce it, it will settle over the course of a couple of days.

Choosing rocks that match your substrate can make some nice hiding places for your fish and keep your tank looking natural. Pick several that match, or perhaps a larger rock could be broken into a few smaller pieces, like Fiji live rock, for the tank.

Ensure that you position elements in your tank so they are far enough from the glass to allow you quick access. Rocks or ornaments which are too close to the edge makes it difficult to clean the glass. Don't forget to be creative when building your fish tank. Besides being home for the fish, you can create an aquarium a beautiful piece of art that can be quite a focal point for any room in the house.
