LIDAR Companies Help in Tapping Petroleum by James Blee

Article published on May 3rd 2012 | Advertising

What is the most important reason that has made the lidar companies a preferred choice among organizations involved with construction and engineering arena?

The answer to this question lies in the ability of the lidar companies to devise ways in which the tapping of natural resources such as petroleum becomes relatively easier. With an abrupt increase in population beyond imagination, it has led to a severe scarcity of natural resources such as oil, coal and various other fuel sources.

At the same time, this is also equally true that there are many areas that remain undetected and thus these vast areas do contain a lot of natural resources. It is by suing the techniques of lidar scanning that detection and tapping of such undetected resources becomes relatively much easier. This explains why this technique has found a huge response from the petroleum industry. By using the geographic information system, it becomes possible to manage, analyze and capture data.

It may be noted, the oil and petroleum industry very often relies on the technique of lidar scanning. The experts of this industry say that it gives them the much needed help when it comes to proper application of technique in managing facilities, exploring petroleum and managing the pipeline. Previous experiences have proved that it gives the users some valuable indication of existence of reserves of gas and oil. Topographic mapping is one area where it is often put to use. Traditional satellite sensors have the limitation of providing only the 2D data. However, under this method obtaining 3D data become possible which helps the researcher to measure height of tree, canopy structure and forest biomes. Ortho photography, plan metric services and aerial photography are these popular services provided by the Lidar mapping companies. These companies have given the perfect assistance to the researchers in find new reservoirs of natural resources and reduced complete dependence on existing resources.
