Article published on March 10th 2012 | Advertising

Majority of us do not get our cartridges refilled after the first use, we simple throw them away. But the problem with this act of throwing away cartridges is that we are destroying our environment without even knowing. Printer cartridges and toner cartridges are made of plastic, and the more cartridges we waste, the more plastic we add to landfills.

The question which arises now is that what exactly should we do with our used cartridges. The answer to this question is very simple. There are two solutions to this problem. First of all, we can get our empty toner cartridges refilled and reuse them. The second solution is to recycle cartridges instead of wasting them. The recycling of cartridges is more preferred due to several reasons.

The first and the foremost important reason of recycling cartridges is that the recycled ink cartridges can be turned into something useful rather than just throwing them into waste. Secondly, producing new cartridges is way more expensive as compared to recycling the used cartridges. As far as the environment is concerned, it is our duty to protect it and play our role in keeping it green and healthier.

If we keep adding waste, especially plastic, to landfills, we will definitely not be playing our role properly. Thus, we should recycle printer cartridges and make sure that we breathe in a clean and safe environment. Recycling cartridges has been made easy by a number of companies. There is no hassle involved in the process, we just need to contact those companies online or via telephone and they send their people to collect our used cartridges from out home and recycle them, themselves.

Over the past few years, recycling has been advanced in a number of ways. Today, recycling is done using special machinery and techniques which hardly produces any toxic. Especially the introduction of greentech recycling has made the recycling environmental friendly. The smoke and fumes exhausted in the air are very few and the waste is minimum too.

This procedure of recycling has encouraged different companies to recycle products rather than just wasting them. Another advantage of recycling cartridges is that it saves costs, not only for producers but for buyers too. The recycled cartridges are much cheaper than the brand new ones, so students can easily afford these cartridges. Even offices and factories which have thousands of print outs every day prefer using recycled cartridges rather than new ones.

According to a survey, it has been proved that the cost of purchasing a new printer cartridge is approximately equal to purchasing seven recycled cartridges. Thus, purchasing recycled cartridge saves money. It can be concluded that recycling cartridges can help us keep our environment safe and can also help us save a lot of money. The cartridge save is the main objective of the green tech toner manufacturer UK.
