Oxygen is the most important requirement for every person and in fact the oxygen inhaled into the lungs is utilized for purification of the blood cells and other cells in the body. However, on account of some obvious reasons, some people are not able to breathe properly and under such situations, there are some external arrangements through which oxygen is supplied to the lungs and portable oxygen concentrators are very much helpful during such situations.

In fact, such concentrators nowadays are available in different shapes and forms and depending upon the usage and requirement such equipments can be utilized by people. There are some oxygen machines which can be comfortably installed at homes and in fact oxygen generated from the machines is supplied through pipes and by keeping such pipes on the nose for certain amount of time, the patients are able to get more oxygen and in fact they can have such arrangements in their bed rooms so that they are able to get the oxygen as and when they want during night.

In fact, these types of arrangements can be found in big hospitals and they have exclusive oxygen ducts through oxygen can be supplied to the patients. Now, since such facility is available in portable form, people are able to carry along with them the portable oxygen concentrators and nowadays it is a very common scene to see in airports wherein some people used to move from place to another place keeping one brief case in their right hand and the concentrator in their left hand duly kept in a trolley.

Taking into consideration the difficulties experienced by the patients, the railway administration, transport authorities and airport authorities are permitting the patients to keep along with them the oxygen machines so that they are able to get uninterrupted quantity of oxygen during the course of their journeys.

When it comes to the usage of external equipments exclusively meant for supply of oxygen through such portable machines, the users should follow certain responsibilities namely; the equipments should be procured in such a way that they can be carried along with them and to that extent, the equipments should be weighing less and easily movable from one place to another place. Normally, nowadays, instead of using aluminum or steel containers, the manufacturers are providing the machines made out of moulded plastic materials so that the weight is found to be very less akin to recently available brief cases and suit cases.
