Bitdefender Antivirus Plus by Harish Sheel

Article published on February 13th 2012 | Software

Today the market is flooded with lots of anti viruses which are available to protect the computer systems from any kind of threat which can be virus, worms, Trojans, malware or adware etc. since the different companies are launching more and more anti viruses with the advanced features as compared to their previous version, Bitdefender Internal Security has also launched an advanced antivirus, Bitdefender Antivirus Plus 2012 recently in the market.

It is no less than any competitors in its performance and any kind of features. It keeps away any kind of security threat like unauthorized access, viruses, malwares etc from the computer system which can harm the system or causes the data loss that can be confidential also. It halts any kind of attempts that can give the chance to the intruder to hack any email ID of the user. It also warns beforehand to the user about any kind of risky website before its browsing.

It also scans the USB devices on insertion into the system to detect any kind of security threat that might have entered into it through any means. It also checks the links sent by the facebook or twitter friends to the user. Its awesome feature is the Autopilot feature. Due to this feature the user need to configure anything. It works itself on detecting any kind of threat on itself without any need of the input from the user. It reboots the system in a virtualized environment which is used by the antivirus for the cleanup and restoration of the data.

It also has the feature of isolating the browser from the operating system in order to deal with any kind of web threats. It can check any kind of missing security softwares which can risk the security of the system. It also protects the private data of the user by not allowing it to leave the system. It fails any kind of phishing attempts to steal the important data.

It doesnâ€™t affect the performance of the system because it only works that time when the system is idle or the processor usage is below the threshold level. It can be installed within 2 minutes which are pretty less. Its hardware and software requirements are also very less and compatible with all kinds of operating systems. The main problem related with this is its high boot up time and shut down time. But they are left aside then it is a great thing to deal with.
