Fire fighting with foam system by James

Article published on February 23rd 2012 | Technology

Fire suppression system is a fire fighting equipment which is commonly used with smoke detectors and fire alarms to enhance the public security and safety mechanism of a commercial building or house. This is a new technology which was introduced in 1990 to protect the building from the wrath of fire. This system helps in controlling the magnanimity of fire in a very short time. Some commonly used fire fighting equipments include the domestic fire extinguishers, the application of sand and water and blankets..

In the newly enhanced systems, one of the best equipment is the foam system as it helps to control the spreading of fire by emitting foams from its machine. Foams are mainly used in laboratories to control the fire and then cool it down into a different form. Commonly it is best to install the water sprinkler and smoke detectors. As said, if there is smoke, there is fire. So the smoke detector once identifies the fume the water sprinkler starts automatically working and releases water to control the fire. These new age equipments have helped in enhancing the fire controlling system.

Today the fire suppression system is equipped with different means like, foam, sand, water or some special gases to help in controlling the spread of fire immediately. Fire spreads due to oxygen contact. New systems have been incorporated to cut down the contact between fire and oxygen. Thus, it can immediately change the fire in to solid ice and controls thee spread of fire.

So if you have decided to install such fire fighting measure in your office, do upgrade all the staffs about the usage of the equipments. Give them proper training so that they learn how to use such systems and save themselves if a fire breaks out.
