Hire Dedicated Drupal Developer for Money-making Drupal Development by Sudha Vishwakarma

Article published on June 8th 2012 | Web Design

Drupal, being primarily written in PHP language, is one of the most SEO friendly and free open-source content management systems(CMSs). Drupal requires a MySQL database and is one of the most popular systems for managing content in your website.

Drupal began as a homebrew collaborative newsboard or a social networking site developed to help its creators Hans Snijder and Dries Buytaert and their friends, stay in touch and share announcements, ideas, and news among them. After their course was over, Snijder and Buytaert wished to keep this collaborative system running, so they put registered it with the name drop.org.

As the time passed, the informal system created by Snijder and Buytaert started attracting a huge audience. At then, Drupal already possessed most of its features it does today, with the inclusion of the ability to create blogs and forums, user modes, moderation and RSS feeds.

In the evolution of Drupal, at this stage, Buytaert, Snijder and few others did all the programming and modifications themselves. Gradually, obviously, numerous requests for new features commenced from all over the community which made Snijder and Buytaert to release their software, now retitled as "drupal" as open-source that is free so that it could be altered and accessed by anyone who had minimum knowledge of drupal concepts. In addition to this, the source code was handed over to the entire website drop.com community and were permitted to edit it as they desired.

In the next coming years, Drupal did change tremendously and a number of versions (v1.0 to v4.7) were released. Several new modules were added to the original version by the community in order to extend the basic functionality of Drupal according to the requirements.

Drupal 5.0, unveiled in 2007, encompassed a number of brand new refinements and features, including more CSS, PHP, JavaScript, Form API and PHP features for developers' use, as well as enhanced performance tuning, user management, theming and better module administration. In essence, to make it more easier to use and distribute Drupal than before, a new adaptable web-based installer was launched for the first time.

It was in february 2008 that the latest version of Drupal i.e. V6.0 was released. In general, v6.0 was developed with the intention to increase the user-friendliness of Drupal as compared to its predecessors with the inclusion of

1.in-built user controls,

2.an easy-to-use installer,

3.drag-and-drop interface,

4.enhanced Multiple language features,

5.support for the OpenID, an authentication project,

6.latest security features,

7.more utilities for theme development and management.

The prime motivation behind the creation of Drupal 6.0 was to intensify the accessibility to gather more and more non-programmers and web developers.

The job to hire Drupal developers is troublesome and of course not an easy job. To hire Drupal developer or say, to hire dedicated drupal developer in the current market truly seems next to impossible. Not every or only small number of drupal developers in the market are good and at the same time have the required skill set.

Dedicated drupal developers are a rare or not easy to find breed. The job to hire drupal developers is very time consuming and cumbersome. To hire drupal developer, one must check for the primary skills to be exhibited on the job, such as clear knowledge of OO PHP, system design, web basics, CSS/HTML, SQL alongwith solid coding technique. In addition to all this, to hire drupal developer, the recruiter must also make sure that the developer has good and correct knowledge of drupal programming concepts. Dedicated drupal developer is the one who has considerable years of experience in drupal programming.
