Article published on August 17th 2012 | [Business](#)

Typical virtual directory server is designed for cost-effective user directory correlation projects. Organizations are then able to acquire single, logical view of all customers in distinct directories for authorization and authentication purposes. There are various troubles that a virtual directory can also be capable of solving within the atmosphere. A great deal of organizations currently have located out that they can actually advantage from working with a virtual directory in comparison to other technologies or approaches of consolidating data coming from unique sources. An additional cause why it becomes a need to for many organizations currently to produce use of a virtual directory is due to the fact of the truth that it may serve as both firewall and proxy to LDAP directories and databases.

They are prone to security and DoS attacks. When a virtual directory is employed into the existing Active Directory infrastructure, it could enable prevent these attacks from taking location. As a LDAP proxy, the virtual directory can maintain information in addition to their retailers secured against potential access and attacks. You will discover many roles a virtual directory can play that are all critical to most organizations in their day to day business operations and this created a virtual directory stand out more than the rest of the other technologies most especially with the traditional ones.

Furthermore, they are equipped with advanced capabilities that no other technologies possess. A virtual directory is meant to resolve the challenges of identity integration in diverse environments exactly where organizations are capable to finish and secure IdM infrastructure. It can be capable of leveraging current infrastructure investments, giving non-invasive remedy for identity management specifications and information security. Via virtualization, the virtual directory applications in the intricacy of unique sources of information and can make it less complicated to publish new custom views to adhere or meet changing demands of the organization.
