Brief Overview of CNC Plastic Cutting by .

Article published on June 23rd 2012 | [Business](#)

CNC plastic cutting or laser acrylic cutting should always be carried out professionally with expertise and precision. Computer numerical control or CNC plastic cutting ensures that each piece of plastic is cut precisely to your exact measurements.

CNC plastic cutting is carried out using lasers and rotary knife cutters and is automated to ensure your measurements and calculations can be stored, copied for future use. CNC plastic cutting allows multiple pieces cut either at once (simultaneously) or one straight after the other i.e. repeatedly or consecutively until CNC plastic cutting has cut the pre programmed quantity which could range from a few to 1000s.

CNC plastic cutting services also allows for a vast range of complex or simple designs such as complex butterfly shapes, hearts, basic stars, trees and animals. Advanced CNC plastic cutting machines means a range of fabric and materials can be used from card, thin paper, fabric, thin wood and leather as well as laser acrylic cutting. Some CNC plastic cutting companies can offer the full package from the design,

CNC cutting and the finish. Skilled CNC plastic cutting companies should have the machinery to provide a vast range of CNC plastic cutting shapes and sizes from small items to larger cuts approx 2 metres in width. Laser acrylic cutting services can provide a polished edge to the cut item.

When approaching CNC plastic cutting companies, it is a good idea to have a rough draft of your drawing and or design that you can send electronically or have a hard copy to hand. The CNC plastic cutting drawing is then digitised using CAD programs and software by expert and skilled CAD designers. You can then work with the CAD engineers and drafters to improve or modify or adjust your design.

The CNC plastic cutting designers and engineers will provide guidance and advice on how to maximise the material to minimise plastic waste.
