Cleaning Method of Swimming Pool Tile by James Blee

Article published on June 13th 2012 | Business

Learn the cleaning procedures of swimming pool tile to keep your pool free of unsightly molds and dirt. You might be able to afford new pool plaster and tiles but to avoid this you should take sufficient care to keep it neat and clean. Here are some tips of taking care of pool surfaces to maintain its quality.

Cleaning Method

First, start by draining the pool of water. Suck out the residual water from the edges of the floor that are encrusted with lime deposits and hard water. Once the surfaces are dried, use a type of acidic gel cleaner found at a pool supply shop that is used for this purpose. The gel will actually seep between the edges of the floor and get soaked in the deposits so as to loosen the dirt and grime. The deposits that come loose can be scoured and those that are stubborn to remove can be scraped off by using a razor blade. Once the job is done, the gel and the residues need to be wiped away from all pool surfaces.

A professional will take care of the whole job by going around and inspecting every inch of the swimming pool tile and grout to know whether there is any place left unattended. If so, then he will clean it off using the same procedure and make sure that all surfaces are free of deposits and dirt. If there are cracks that need to be fixed, a professional pool renovation specialist can fill them with new pool plaster.
