Data Management: What It Can Do for LA Businesses by Ruby Badcoe

Article published on April 16th 2012 | Business

With your data backed up on CDs and microfilm, and paper records stored in steel cabinets, itâ€™s easy to believe nothing can harm your companyâ€™s vital information. This belief is almost always shattered by occurrences like deterioration of digital media, server crashes, computer hacking, or catastrophic fires. When this happens, all you can do is sit there in despair, not knowing what to do now that your company has lost every shred of data it needs to survive.

/Data management and protection is vital to a companyâ€™s interests. Without detailed records of every transaction or business decision, it would be difficult to present accurate data to shareholders and the public. Threats to the integrity of a businessâ€™s vital documents have to be met or prevented, so educate yourself on the various data security threats you face and how other companies keep them at bay.

Accidents and emergencies are two such pressing threats to data security. Documents could be accidentally destroyed, misplaced, or tampered with, or vulnerable to calamities like earthquakes and fires. By using the services of data management facilities and storing your documents off-site in secure and climate-controlled storage facilities, you can ensure better redundancy and mitigate threats before they even take place.

A good example of a storage facility in the Los Angeles area is Williams Data Management. Like most storage facilities, it boasts of fire-proof and secure facilities that can house your companyâ€™s documents indefinitely. This is particularly useful for storing files like board meeting minutes, medical records, and financial data that need to be kept intact and accessible for extended periods

Keeping your information secure is also of great importance, and sometimes you need to protect that information even from your own employees. After all, a lot of companies that fall victim to fraud and theft were attacked by their own people. Off-site data management services, like the Williams storage facility, can prevent this by limiting your employeesâ€™ access to vital documents which, if exposed or stolen, can really hurt your company.

Records management isnâ€™t only about keeping your document stored safely either, it can also be about proper disposal of existing documents. Williams storage services, like other data management companies, offer a certified shredding service that will dispose of your documents while maintaining their confidentiality. This way, you can be sure your documents are destroyed before they fall into the wrong hands.

Remember, the type of records management system you have can either make or break your company. For more information on Williams storage services or other data management facilities in LA, you can visit DataRecoveryCcompanies.com or browse articles on Forbes.comâ€™s for more information.
