Get Top Value from Thermal Labels by John Durose

Article published on March 27th 2012 | Business

Even though many companies are utilizing RFID for data collection, bar codes are still important, and these allow information that can be read by the human eye can be printed on thermal labels. Using ribbonless labels, you have a cost-efficient way to print the other information supplied, which can help to verify the materials on pallets and inside cases.

Ribbonless thermal transfer printing uses a printer with heating elements to print directly on thermal or zebra labels, and the process is effectively used in warehouses and packaging companies, to print bar codes, as well as other information, including product numbers, lot and date codes and prices.

A thermal label is also an inexpensive way to place additional information onto labels for items that vary in size, color or style from one pack to the next. This program works well in commercial areas like chemicals, paint and specialty foods.

One basic use of thermal labels is that of giving logistics information to company employees and managers. This helps them to track inventory and supplies on a day-to-day basis. The process is an inexpensive way, comparatively, to manage products from the warehouse through expedited packaging systems and on to the final destination.

Thermal and zebra labels accurately process important information about the packages your company sends, and what is in them. They track products through the supply chain. The best labels will allow for fewer misreads, so that inventory can be accurately tracked. Smart labels may utilize RFID tags, but they still need other reliable information, in order to work in an accurate and cost-effective manner.

Printing with the thermal transfer method is an economical way to get high quality and durable printing done, when you compare it to other technologies. The printed area is also more durable than with other types of printing. It can withstand even chemical contact and extremes in weather. Asset and inventory labeling, as well as product identification, requires barcode labels that will last, and thermal labels fit that bill.

The technology utilized in printers with thermal transfer labels will allow your business to more easily integrate barcodes into your inventory and warehouse systems. Even though barcode labels were originally used mainly for retail companies, they have proven themselves to be quite useful in many other fields. The technology of barcode scanning and thermal and zebra labels help to manage and track your products in the supply chain, and they simplify supply and ordering. Run your company more efficiently with the help of thermal labels that can be found at Tigerseal Products.
