Article published on June 14th 2012 | Business

The 2005 flooding of New Orleans left many residences in the suburbs all but abandoned and still retaining water for seven years up to this day. The good news is that flooded houses can still be repaired - with a bit of investment, it can potentially be just like new. Even so, whatever type of repair youâ€™re aiming for, safety is still of utmost importance.

Water damage is a little tricky to repair not just due to the pool of water in the basement; but also due to its negative effects. Water damage can cultivate molds and dampen supports, putting the structural integrity of the residence at risk. Repair tasks are carried out a way that rain water is taken out safely from the key sections without making the house slightly unstable. Here are some safety tips on proper water damage repair.

Turn off power: Water and electricity are 2 things that should never come across each other. A puddle of rain water in the basement can become an electrifying death trap if you donâ€™t cut off the power leading to the basement. Before you can begin the repair job, make sure no electricity is running in the affected part of your home.

Evade direct contact with mold: Unless you inhale it or eat it, mold is generally harmless. Still, it's worth noting never to touch any noticeable mold as a result of water damage, as simply breathing it in can result in health problems. Molds are fungi that thrive on wet places; which means the solution to eliminating them is normally cutting off the moldsâ€™ source of moisture.

Correct water removal: Water removal is completed simply by using a water pump to eliminate water from flooded areas of the home - certainly not a vacuum cleaner. Never get rid of water from your house without the right gear for this. If you donâ€™t have the required apparatus, you could always get in touch with your local water removal expert to accomplish it for you. Leaving it to the industry experts can help you save money in terms of mishaps and, most probably, more repairs.

Act fast: The longer you wait, the greater wear and tear water can do to your property. Water removal should be carried out as quickly as possible, as the damage exacerbates if left for a longer period. Molds, for instance, begin cultivating in just 24 to 48 hours of water exposure.

Most importantly, safety takes top priority whether for water extraction or any repair project. For additional info on appropriate water damage repair, you can go to Water-Damage-Guide.com and its complete arsenal of articles.
