Article published on July 18th 2012 | Business

A1 acetate or A2 acetate printing really needs to carried out by an experienced and dedicated printing company who will have all the necessary printing equipment to create clean and crisp images and text onto acetate of all sizes. Many different businesses require acetate printing services for a wide range of purposes.

Large scale A1 acetate and A2 acetate printing is often required to create large scale plans for architects, engineering drawings and builders and using acetate means that there is a virtually transparent background so the plans can be seen more clearly and will be much more durable than if they were printed on paper. A1 acetate plans will be waterproof and this is why they are favoured by builders, engineers and architects who work outside and need to make sure the plans are not ruined if they get wet in bad weather conditions.

A1 acetate printing services are also used by people who are creating presentations. If you want to print Microsoft Excel, Microsoft Word, PowerPoint or PDF files onto A1 acetate or A2 acetate then this is possible.

The reason people may need this service is so they can effectively present the information that is printed on the A1 acetate or A2 acetate to people in a clear and concise way using a neat and formal style. For any large scale printing tasks whether on A1 acetate or just on card or paper a normal office or home printer will not be able to handle large paper sizes. This is when commercial printing companies are needed as they have specialist printing equipment that is designed to print information on a large scale.

You may only require a small quantity of A1 acetate or A2 acetate printing and if this is the case most printers will be happy to fulfil both small and large scale printing requirements for their clients. The cost of A1 acetate printing will depend on how many sheets you need printing, they type of document that requires printing and how soon you require the printing. The majority of printers who can print onto A1 acetate and A2 acetate will also be able to print onto many other materials such as paper, canvas, tracing paper and water resistant papers.
