Multimedia Duplication and Blueprint Duplication by Eric Johnson

Article published on May 30th 2012 | Business

Many businesses whether small firms or large corporations, require blueprint duplication and document scanning services. These services offer the perfect solution for companies that desire easy data tracking as well as an electronic record of files, contact information, or other valuable documents. If your company is large and has cabinet after cabinet of paper files, it could take an employee more time than it should to find a document. Therefore, in creating digital documents it speeds up the process of finding documents and helping clients faster. Companies that offer document copying services conversion can offer color laser copies and also conversion to digital files that can be backed up. When companies choose to digitize documents, time and money are saved, as valuable information can be accessed quickly and easily. Organizations that provide document copying services use state-of-the-art technology to convert files into digital files. Multimedia duplication services have been used in industries such as health care, legal, and corporate.

Document binding service

Document binding services allow companies to choose from several hard copy binding options such as spiral binding, saddle binding, or three-ring binding. They provide experienced professionals who are trained to offer quality document binding, copying solutions, and scanning services. Trial Exhibit Boards are offered as part of a suite of legal services using eco-friendly materials. Think of how much wasted paper companies go through each year, some do shred and recycle, but still there is a paper trail miles long. Going digital means using less paper, helping the environment, and your whole company has access to these files not just one filing cabinet room. Document scanning Miami services are quite popular and offer companies easy access to their information, saving them time and money.

How Itâ€™s Done

Organizations that offer groundbreaking technology for blueprint duplication utilize a blueprint copier that copies the large image of real documents and digitizes them into clear electronic files or hard copies. These copiers are used to expose draft overlays and pin graphics. Blueprint copiers can be used for positive and negative films, sensitive screens, and sepia prints. The copier includes a vacuum system that ensures total contact with the document allowing proper copies and scans. The vacuum system is important to control large copies of documents.

The difference between a blueprint duplication machine and a large format copy machine is that the blueprint machines all rely on the ability to pass light through the document that you want to copy; therefore the document you are making a copy of must have enough transparency for light to pass through it. Also, the blueprint machine will only make a copy of a reproducible document, such as vellum or trans-bond. Blueprint machines use diazo paper which is yellow in color when it comes out of the sealed bag, then turns blue when it has been ran through the machine. The process that works to expose the paper is done with black lights and ammonia.
