Remote Monitoring Solution Increases Profits by [Ambrose Smith](#)

Article published on May 2nd 2012 | [Business](#)

Oil refineries, gas and manufacturing units observe big loss due to wastage of various supplies such as water, electricity and other useful resources. Maintaining wastage of resources can provide unlimited profit and better environment for the big industries. To make the thought possible and implemented, there are companies involved in providing remote monitoring solutions from past a decade in the industry. Such companies have developed various wireless remote monitoring systems with the help of modern technologies. Satellite, internet and wireless are the technologies used to connect and provide remote monitoring communication between two different devices. Scada system and remote stormwater management are two of the most popular remote monitoring solutions developed and used till date in industries.

The professionals managing the satellite remote monitoring system are highly qualified and experienced professionals from different industries. The technological combination and inputs from experts have helped many big units to minimize the wastage of resources by using remote monitoring applications to maximize their profits. There are few products widely known and used by the industries such as GolderWatch SC, GolderWatch 4D, GolderWatch GHG, etc. Moreover, to help the clients efficiently, the companies have offered various services such as GolderWatch Messenger, GolderWatch Web, Integration and Custom Development. Such remote monitoring solutions have industries engaged in Water and Wastewater management, environmental remote monitoring Solid Waste & Landfill works, Oil & Gas instrumentation OEM, etc.

There have been more than hundreds of projects taken over by the companies involved in remote monitoring solutions. With the help of satellite and cellular remote monitoring the companies have provided great results for the projects that need monitoring for mine, intake tunnel, coastal engineering, environmental site, street tunneling, mountain underground goldmine, off stream reservoir, solar plant development, desert claim wind power, etc. There is hardly any governmental or private projects declines or refused by the company or mentioned bodies. The dedicated team plans every step and detail accordingly to offer on-time and effective results to the clients.

In addition, the competitors have found impossible to chase the remarkable results and value attained by the companies in the industries in past few years. Every month, there are new remote monitoring applications developed and designed by the engineers to make remote monitoring much effective and simple for the clients. Therefore, by minimizing the loss and managing the resources properly through data analysis, many industries are making huge profits by implementing and installing the wireless remote monitoring system in the units.
