Some Common A/C Problems that Need Your Immediate Attention by Abelli

Article published on April 24th 2012 | Business

Summer is a great time to go swimming and picnicking with your family and friends. But for people who have no plans of going anywhere this season, vacation is best spent at home. With a completely working home air conditioning unit, you can get by summer without getting too hot and clammy.

Get your air conditioner ready for summer at least during the late spring. It will be too

late to fix any unexpected problem when hot summer days begin. Make the necessary tune-up while the spring weather is still bearable by inspecting the A/C for damage and removing clogs. As a homeowner, you need to identify common A/C problems, their causes and remedies, and the need to call a professional A/C repair service.

Covered Condenser Unit

During winter, most homeowners like you usually cover their A/Câ€™s condenser unit located outside their house to prevent moisture and melted ice from permeating the system. When summer comes, they often forget to remove the cover, causing the air conditioner to stop receiving sufficient air to cool up. If the same problem occurs with your A/C, go out and check whether or not the condenser unit is still covered before deciding to call a professional repairman.

Faulty Wiring

Some A/Cs end up busted because of faulty wiring. This occurs when the people you entrusted with the A/C installation did a poor job. The A/C wiring must be certified by a mechanical or air conditioning engineer before it can be used to prevent fire hazards or electrocution. In some cases, faulty wiring may lead the A/C to produce warm instead of cool air.

Low Amount of Refrigerant

The A/C produces less cool air when the refrigerant runs low. Unlike motor in a car engine, this fluid does not run dry in an A/C system and so the only possible cause of reduction is leak. Check for leaks and make sure to close up the passage to keep the refrigerant running smoothly. You can immediately call for air conditioning service Indianapolis and other prominent cities have to offer when something more serious have caused the decrease in refrigerant.

Dirty Filter

Much of the air that an A/C cools and blows into the house comes from the outside through the condenser unit. A filter system allows only clean air to be transported into the unit. When the filter is filled with dirt, it should be replaced right away before any problem that requires air conditioning repair Indianapolis recommends occurs.
