All the medical operations that deal with the prevention, diagnosis, treatment and rehabilitation of any nervous disorder are termed as neurosurgeries. These include the brain, spinal cord, peripheral nerves and extra-cranial cerebrovascular system. A variety of symptoms such as paralysis, muscle weakness, poor coordination, loss of sensation, seizures, confusion, etc. may originate as a result of neurological disorders. Neurosurgery methods have advanced and become such a banal matter that Neurosurgeons India is the most sought after medical profession in the country. Surgery is used for both diagnosis as well as treatment of neurological disorders. A neurosurgeon is a trained specialist surgeon who operates on the spine and brain.

The general procedures done by the Neurosurgeons India are removal of brain tumors, management of some spinal cord conditions, spinal surgery, clipping of cerebral aneurisms, etc. In case of neural issues, the local doctor who is consulted will generally redirect the patient to a specialized neurosurgeon. Experience in the same problem that the patient is facing is a factor that should be taken into account while choosing a neurosurgeon. Getting a surgery done in a public hospital generally does not cost, but having medical insurance will cover up almost the whole expense and makes it easier. More expense need not necessarily mean a better surgeon or surgery. In the present scenario, the level of care that a private hospital provides is improving everyday than that of public hospitals. Presence of cancer or severe compression on the spinal cord or cauda equina calls for an immediate surgery. The conditions that neurosurgeons generally treat are spinal disc herniation, cervical and lumbar spinal stenosis, head and spinal cord trauma, tumors, infections, hydrocephalus, intracerebral hemorrhage, vascular malformations, some forms of psychiatric disorders, etc.

The numerous Best Hospital India provide different forms of neurosurgical options such as radiology methods including CT scans, MRI, PET, magneto encephalography (MEG), and stereotactic surgery. Microsurgery is commonly used in many aspects of neurosurgery. For EC-IC surgeries, microvascular anastomosis (opening created between two normally separate spaces or organs under a surgical microscope) is used. For pituitary tumors, craniopharyngiomas, chordomas, etc. endoscopic endonasal surgery is performed. Cranioplasty is the process by which disorders such as chiari malformation, craniosynostosis, and syringomyelia are treated. For the treatment of aneurysms, AVMs, carotid stenosis, strokes, and spinal malformations, and vasospasms, neurosurgeons are utilizing procedures that make use of endovascular images.

Looking for performing surgeries at the Best Hospitals India? Then Dheeraj Bojwani Consultants is what you are looking for! They are India's most reputed medical tourism agents and have established a strong collaboration with the top-class and hi-tech hospitals in the country.
