A Virtual Telephone Service, Understanding and Choice by [John Peterson](#)

Article published on June 4th 2012 | [Communication](#)

Navigation technology is a complicated process. Each sector has its own technology, foreign language, buzz words and purpose. Just remember the last time, read the instructions on how to install something on your computer, or fixing something in the car, or even set up a child's toy. This is the usual things, and we should be able to understand the things we use everyday basics. Instructions seem to be written by "techies" and written to read "technical." They often fail to convey the sense of those who do not speak to specific technical language. This does not mean we can not understand the technical nature of the item, it means the writer did not put it in our own language. I can buy a car in France, but the user guide is in Japanese. Since you do not speak the language, you can not understand the user manual. Technology suffers from the same failure, and we gave birth to the whole community known as "technophobes." Failure of our technical side, there is a good communicator.

OK, enough rant my day! Now, the virtual phone numbers. Go to the store and buy a mobile phone. Your new phone comes complete enough features to keep you busy months. It has email, internet, music player, camera, and a long list of features, into the list here. However, even with all these choices, what's your choice telephone number? Probably few or none. In particular, the incoming phone number location. You live in Sydney, and you'll get the number of Sydney. Now, of course, this makes some sense. People in Sydney are less likely to call you if your number was in Rio de Janeiro. However, let me suggest that your brother lives in London, do your parents live in Auckland, and you have important business to customers in Singapore. Would not it be nice to your brother to call a local number in London, and your phone rings in Sydney. If your parents are elderly, they may get confused dialing internationally. Local Auckland to solve. And you look like a star, when your valued customers will no longer have to pay long distance charges to you. This is the magic of virtual phone numbers.

Until recently, these types of services require you to be connected to the Internet, and use the computer and get your calls. It has its own advantages and disadvantages. You can take your laptop almost anywhere and connect to the Internet is easy to hotels, meetings, cafes, or just about anywhere. You no longer were required to sit in your office or home waiting for the phone call. Voice mail is an excellent but when a client asks you to pick up the phone. disadvantage is that you need a computer, it must be connected to the Internet, and often must pass strangeness, using a headset connected to your computer. You are currently traded on the phone simplicity, notebook portability. recently the ability to present your virtual phone call to your landline and mobile telephone matured. You can do this before, but it was often difficult, expensive, or both. especially for your cell phone.
