The word “Computer” is synonymous to a machine which can perform task (compute) faster than other and in a more accurate manner. However, if it doesn’t serve the purpose then it’s meaningless. Who will wish to have a computer or laptop which runs sluggish, takes minutes to browse through a site, or have to incessantly wait to download favorite movies or programs? Both manufacturer and developer understand the facts, and needless to say that much have been done. Today, you have Windows 7, Office 2010, Internet Explorer 9 and similar programs which run with much pace than their previous counterparts used to and are pampered with astounding features and functionalities, which were not less than day dreaming. You can perform more, with the Intel next generation processors like Core i3, Core i5, and Core i7. Apart from furnishing basic computing attribute, brands are focusing on entertainment, collaboration, networking and connectivity aspects as well to stay par with the growing expectation and challenges ahead. With the latest technologies you can experience vivid Web and video content, sharp photos and crystal-clear music. Video conferencing and collaboration through Office Web Apps bring entire world within you reach. Consolidation and virtualization of server gives you a hold on your business data, which can be managed in a better, flexible, scalable and secure way, without raising the IT maintenance cost.

Undoubtedly brands are approaching positively to make your digital life smooth, fast and secure. Those are benevolent enough to add PC Tune-up utilities with the operating system, and their intellect usage can help you a lot to do more with your machine besides fixing meddling issues. However, before that you should know the crux. Like bunch of issues could be related to slow performance, but you can’t tweak system settings without knowing the actual reason. There are many reasons: faulty power saver setting, multiple anti-virus programs and unwanted startup programs, clutter on the hard-disk, and too many user accounts, are a few to include. Instantly trim unwanted programs from the startup, delete obsolete or additional security software from the Control Panel, and if the issue is related to memory then running PC Tune-up maintenance tools like Windows Defragmenter or Disk Clean-up can fix the problem. The latest Windows 7 holds an important platform as Action Center, here you can see what is the actual system problem, and can have an easy one click fix. If your PC is suspected to bear viruses, spyware or malware then freely download Microsoft Security Essentials to scan it. Suppose, if you have tried everything, but still you have the thrust for performance then disable some least important functions such as Search Indexing, Aero and other unwanted Visual Effects and Services.

Third-party computer Tune-up tools are also available on the Internet. You can go through their customer-reviews and check the specifications before proceeding. These tools can fix Windows Registry errors, defragment the system hard-disk, remove unwanted programs, clutter from web browsers, online chat programs, and web toolbars. However, if the scope of troubleshooting is beyond your expertise then leaning towards online computer support portal is a good option.
