If you use a computer at home you have to make sure it is secure and unable to be accessed by anyone else. This article will help you to ensure your computer is as safe as it can possibly be.

It's an exciting task to unpack a brand new computer and set it up for the first time so you can start using it. But before you can enjoy it and go online to surf the internet, you must make sure it is completely secure. The internet is filled with hidden dangers and if you are not protected against them you could find your computer is ruined.

So what do you do? The first step is to ensure there is a firewall between you and the internet at large. Computer speak can be complex to understand but a firewall acts as a large lockable front door. Imagine your computer is your home and the internet is the world outside. Would you leave your front door wide open if you went outside? Of course you wouldn't - you'd lock it securely behind you. But if you don't have a firewall in place on your computer it's the same as leaving the front door open and going shopping. Don't be too surprised if things are missing once you get back!

You also need some way of combating the many viruses, Trojans and worms that are lurking online and could cause your computer harm. Some of these are simply malicious whereas others are designed to try and get onto your computer to harvest information. But whatever the aim might be, they are all immensely damaging.

Luckily there are lots of advanced products on the market that can take good care of your security needs. Netbook Antivirus is good for netbooks, whereas products such as Panda Security are ideal for computers. Make sure you understand what type of product you need and choose something that will suit your needs. The more a single product can do to protect you and your computer every time you switch it on, the more cost effective and useful it will be.

When it comes to buying items such as Netbook antivirus software and

Panda Security software, you should always take the time to compare them against others in the marketplace. This will enable you to figure out which ones will provide what type of protection. Some have more than one product rolled into one. So for example you might get a firewall, an antivirus product and an anti-malware and spyware product as well. Needless to say the more protection you can get the better it will be - and the safer it will be as well.

So when you are considering how safe your computer actually is, the answer will lie in whatever software you have to protect you. Don't delay in getting proper software if you don't already have it - the sooner you are protected the safer you will be. You simply cannot risk anything less.
