Intel Processor and AMD Processor the best processors available at market by [Haris Portfield](#)

Article published on April 19th 2012 | [Computer](#)

Computer technology has revolutionized the whole world around us. Thinking of speed, time and efficiency in a computer can only get by a good processor like Intel Processor and AMD Processor. Processors are actually the life line of a computer just like human being's life line relies on heart and brain similarly computer has the same fact in it. A good processor like Intel Processor and AMD Processor make a computer so much efficient that one can't think life without it. In older times every computer had one single processor in it and this was the reason why those computers and laptops worked so slowly. By some latest researches and new changes brought in computer technology, now a computer and laptop can have more than one or even two processors in it. It doesn't mean that now you will have different processors attached on mother board by different slots but actually these multiple processors come packed up in one small little case hence it seems to be one processor but actually number of processors are working inside. You can consider this thing just like the computer casing, when a computer is built up all the important sensitive and non sensitive parts are fixed in that computer casing. Usually all these casing come with the own power supplies attached with it. As this body covers up the all parts in it and gives a simple look of one unit similarly the body of one processor covers several processors in it. That is why said the more cores a processors have more efficient it would be.

Laptop's processors and some other parts of it are more sensitive as compared to the desktop computer parts. The computer casing is thick enough to keep the parts of the computer safe from getting damaged but unfortunately laptop is much more sensitive in this regard. Although a laptop has a compact tight enough computers casing but yet more care is to be taken of it. And the thing which is more on stake is the processor of the laptop. In an effort to make the laptop processor safe from getting damaged so easily special kind of processors are made now. Intel Processors and AMD Processors are of various types, each is manufactured according to the demand of the model of the laptop. Like if talking about notebooks a derived version of laptop also has special type of processors built by these top companies. As the notebooks are small and compact in size and has limited functionalities they don't need to have extreme high quality processors. Like for them AMD C-30 and Higher, AMD E-240 and Higher, Intel Atom N2600 or Intel Atom N450 processors are good enough.

But if you talk about a real Laptop which has almost everything in it yet light to be carried everywhere than such kind of laptops have AMD A4-3300M, AMD A6-3400, AMD E-350, Intel Core i3-2310M, Intel Core i3-2310E, Intel Core i5-2410M, Intel Core i7-2610UE these processors which are specially built for them. A good processor always makes your computer give the best output rest it all depends what's your choice.
