Article published on May 14th 2012 | Computer

With everyday improving computer technology there could be many reasons behind why your computer runs slow? Before you choose to pay costly technician fees for PC repair have a look at list of solutions if applied can improve your PC speeds instantly.

Remove junk data:

Most of our PC has lots of junk or useless data available which are the main causes of PC running slow. They are in the form of temporary files, demo programs and so on. In order to recover your computer from slow performance, delete all unused programs, clear temporary files and other garbage data. This action will free valuable memory space which your PC can use for better performance.

Spyware/adware common trouble:

The internet is almost in every home and if you are a net surfer also, spyware and adware are some of the most common reasons behind PC running slow problem. Most easy PC repair solution for this problem you can get is to install a good Anti-spyware program. The anti - spyware software also come attached with anti-virus software so next time be careful while choosing anti-virus for your PC.

Defragment hard drive:

If you need instant and easiest solution for PC running slow problem there is a program called defragment hard drive available on every computer. Itâ€™s available on most PCs. What it does is it clears every bit garbage data lying anywhere on your hard drive and is the ultimate PC repair. Once the process is finished you might be amazed how energetic your PC has become from earlier. Defrag program also arranges data in the best possible manner.

Clean windows registry:

Statistically proved record shows every time your computer runs slow, 90% of the time the reason behind is windows registry experienced some error. Every time you install software on your computer or run or uninstall, some registry entries are made. These registry entries create errors in the system due to software not responding and many such failures. These errors grow continuously and only solution to this problem is to download a verified registry cleaner tool which removes all unwanted, bad, corrupted registry entries. System performance can drastically increase once the cleaning process is complete. Its recommended to choose a trusted registry cleaner software only as all tools are not same and registry is one of the important document holder in every PC.

Memory upgrades:

In 98 times out of 100 above solutions will definitely solve your computer runs slow problem. If above solutions are not helpful to you then most probably your PC is fully fixed and already delivering maximum performance speed it can. If you still desire to increase the performance speed only thing you can do is to upgrade the memory. Every PC system has RAM (random access memory) installed which work as a performance booster. Most motherboards support RAM memory up to 8GB. If your PC is little too old it might have less RAM memory installed. However one can upgrade RAM memory according to desired performance and cost to upgrade is not sky high.
