The uses for a Fingerprint Reader by [Mary Porter](#)

Article published on June 19th 2012 | [Computer](#)

A fingerprint reader has many different uses and lots of different businesses and industries utilise fingerprint reader technologies in their workplace settings. Some fingerprint reader devices are suitable for outdoor use and are waterproof. These are commonly used as a security feature so only authorised personnel can access a building.

A fingerprint reader can also be used for checking time attendance, providing access control to offices, residential and industrial workplaces, for integrated payroll and the HR management of employees and for data collection for customer reward schemes. Fingerprint reader technology is fool proof and highly reliable as no two fingerprints are the same so there is no way to trick the system. Investing in fingerprint reader technology devices may be more costly than other methods but with its guaranteed reliability, superior functionality and accuracy you will not be disappointed.

Many fingerprint reader devices will allow for a number of different functions and can be used for a variety of purposes at the same time. Most also provide a fingerprint reader along with a keypad and card reader for a variety of input options. For extra security you may have to scan your fingerprint and enter a security code and this type of high security is needed in some places like banks, high security safes and hazardous workplaces where only trained staff are permitted to enter certain areas of a building.

Some fingerprint scanner devices allow access to data and can be incorporated into USB devices like flash drives, portable hard drives and computers to provide safe and secure access and ensure only authorised people can access secure data. Fingerprint scanner and fingerprint reader devices are used in petrol stations where 24 hour shift workers are often unsupervised and the employer needs to know they are working their correct hours and they may also be used for access to the tills to show who did what transaction to stop employees stealing.

Fingerprint scanner technology is also used in large shops and restaurants so staff can clock in and out and in large factories and warehouses where it can be difficult to keep track of employees attendance without a fingerprint scanner which they have to use to gain access to the workplace and register that they have entered and left the building.
