Find the Perfect Forklift Ramp by Rachel Martin

Article published on December 28th 2011 | Customer Service

While they are very useful around your complex, forklifts are also inherently dangerous. They are built to be stable on flat surfaces, and when fully loaded they can be even more precarious. Thatâ€™s why there are such strict rules about the drive of forklifts, and why you should take extra care when selecting a forklift ramp for use in your facility. You need to choose the best ramp for the job, and that means that you have to have all the information necessary to choose correctly.

Because forklifts work best on flat, stable surfaces, you need to find a forklift ramp that has just the right amount of incline to keep the forklift stable. This is the designerâ€™s purpose in making the ramp. A new or used forklift ramp is usually built out of non-corrosive metals and designed to carry your heaviest loads. Check maximum weight capacities when you consider a new or used forklift ramp. Every ramp structure is supported through the ample use of crossbeams and pillars, which means that your forklift drivers will remain safe while they use the ramps. Added support and maneuverability is often available through hand levers or hydraulic pumps that allow you to adjust the height of the forklift ramp.

You need to be sure that your new or used forklift ramp is being treated with respect. Because forklifts are compact machines, they are very vulnerable to tipping when in tight maneuvering situations. Your forklift ramp must have a gradual incline suitable for the machine that will be using it. The gradual incline will protect your materials, your forklifts, and most importantly, your employees.

There are many varieties when it comes to buying a used forklift ramp. You can choose between aluminum and steel ramps, for example. Despite the differences in the two materials, they are comparable in price, which means you can focus on choosing the forklift ramp that is best for your situation. Aluminum is a lighter weight metal and that means it is more portable. You may think that it is a less sturdy choice, but ramps made from this metal are actually capable of withstanding thousands of pounds without any trouble. Of course, steel is still sturdier, and that means a higher maximum weight capacity and a longer lifespan for the equipment.

You can find many options for your new or used forklift ramp purchase at yardramprental.com. Choose between steel and aluminum, rentals or purchases, or even mobile and stationary ramps.
