Backup Techniques to secure your Important Data

by John Bentrick

Article published on April 5th 2012 | Data Recovery

IBackup is a really good choice for an online backup and cloud storage company, but they have some really stiff competition. SOS has really made a strong name for themselves and is taking the online backup world by storm. Their affordable pricing and high quality features have brought them customers from all over the place. There are a few things that they have done particularly well, especially in comparison to a company like IBackup.

256 - bit encryption software is the tools of choice for both IBackup and SOS, and for good reason. This is what banks use, and what some parts of military installations choose to use as well. It has been proven to be one of the most secure versions of encryption software available on the market today. Even though it is so readily available, it is nearly impossible to break. Since you can schedule when backups occur and put security restrictions on different accounts, all of your information is as safe as it can possibly be.

Data recovery services entail the recovery of data from a computer's hard drive. The hard drive may have been formatted or damaged. Computer forensics is a special branch of computing that deals with complex data recovery to ensure that valuable data that has been lost is recovered in as much of its original state as possible, and to trace the data security path to determine why the data was lost in the first place in instances where foul play is suspected.

It doesn't matter how expensive or luxurious a computer or laptop is. There will always come a time where they crash and break down. There are numerous reasons why systems crash. This usually results in the loss of important files and documents. Some causes may not result in the loss of data, however, when a computer or a laptop crashes, you will obviously have to bring it for repair. How can you continue working on your current assignments, reports or projects, or even have access to all of your pictures, music and videos if your PC has to be repaired? Repairing these machines will take a long time; at least a week,or even longer. Also, your CPU's condition may leave repairmen with no choice but to format it, which will result in the loss of files.

If you are using your computer or laptop all the time for work-related items, such as documents, reports and other important files, or just to store memories in the form of pictures and videos, it is always best to keep copies of every important file you have. It is also recommended that you store extra copies on different backup products, so you will really not have to worry about your important documents getting lost even if you have no control over the reason why your PC had to crash.

Performing backups are essential and need to be done at least every day, because you never know when your PC could suddenly crash or when your laptop might all of a sudden get wet, which could result in the loss of all of your files, including the most important ones. Won't that be extremely frustrating The common problem among several people is that they don't even think at least once about generating copies of all of their essential files and documents until unfortunate events, such as the crashing of computers and natural disasters, like floods, earthquakes, hurricanes and more, force people to realize the importance of having a backup of files, making them wish to have done so in the first place, while there was still the opportunity to do so.
