An anti wrinkle cream that contains Matrixyl is considered to be highly effective. Scientifically, Matrixyl is known as palmitoyl pentapeptide. Scientists, in a bid to discover ways to quicken the healing process, found a connection between this compound and the production of "fibroblasts." This is a substance that our body secretes to heal a wound during an injury.

Fibroblasts stick together the injured skin tissues with new tissues. During this process, they activate the production of Collagen IV, Collagen 1, glycosaminoglycans, and fibronectin. All of these contribute to maintaining the suppleness and overall health of the skin.

How to look younger?

Do you know that fine lines and wrinkles appearing on the skin surface are actually wounds on the skin?

This happens when the skin decreases its production of collagen. This may either occur naturally as the years pass by or certain external factors may damage the skin, leading to a decline in its capacity to produce collagen.

When the collagen levels decrease, the connective tissues fail to support the skin from beneath. This results in the skin surface forming gaps, causing furrows. This is what we call wrinkles and lines.

Matrixyl repairs the skin from its matrix or structure. It helps to restore the level of collagen by stimulating cells to produce it. This smoothenes the skin once again.

Test the collagen levels of your skin

Does your skin produce enough collagen? Are you in the brink of aging? A simple test can help you find out whether you are going to get wrinkles and lines soon, or not.

• Pinch an area of your facial skin.

• If your skin has sufficient collagen, the area that gets folded by pinching will jump back to its original smooth position.

• If the collagen level is insufficient, the area will take a longer time to revert to its original position.

The longer it takes for the fold to smoothen out, the greater is the decrease in the level of collagen in your skin. An anti wrinkle cream containing Matrixyl can help the skin to normalize its collagen level.

According to a study, women using such a cream noticed more than 60 percent decrease in the number of wrinkles and about 50 percent decrease in the depth of the creases of each wrinkle.

The wonders of Matrixyl 3000

Scientists studying Matrixyl have found that this compound increases the total collagen production in the skin by about 117 percent. There is a 300 percent increase in the level of Collagen IV. The

compound also stimulates the production of hyaluronic acid in the skin by nearly 250 percent.

Do you know hyaluronic acid is naturally present in the body? It contains amazing absorption capacity. In water, it can imbibe nearly 1000 times its own weight. When the body contains enough of this acid, the skin naturally stays hydrated, supple, and fresh.

An anti wrinkle cream, that contains Matrixyl and this acid, will definitely be effective in restoring the skin's youth. Such a cream repairs the skin from its core structure. It is, indeed, a priceless cosmetic to have in your beauty box.
