Advice for Buying Trading Computers by Thomasgalvin

Article published on January 11th 2012 | Hardware

Anyone who is new to day trading will soon find out that having the right trading computer will be necessary for true success. A lot of people use their regular home PCs when they first start out and that may be fine, but soon you will notice that time lapses and insufficient speeds will eat away at your chances of making the quick decisions that are much needed in the trading field. Trading computers that are specifically designed to handle the power and speed required will help to advance you in your hobby or career as a day trader. When you first begin trading from home, the processes and applications used on your computer will soon increase, especially if you decide to take on more stocks. The more stocks you need to watch, the more windows that need to be open and without sufficient memory RAM this will be nearly impossible.

Computers work best when they have enough power and speed. Just like a car, you will want something that has a great engine and wheels. Without one or the other, you wonâ€™t be able to get to where you need to go. A trading computer is built with a good motherboard (the engine) and has great processor speed (the wheels), allowing you to do what you need to do when you need to do it. Its motherboard will allow you to be equipped with lots of memory RAM, a big hard drive and high definition graphic s cards. You will also need a PC that can handle multiple monitor screens. Trading computers are custom designed, so you wonâ€™t find them sold at your local Best Buy or Sears.

When searching around for a trading PC, you should find a reputable company that customizes desktops, not laptops. The reason why you shouldnâ€™t use a laptop is because they arenâ€™t built for th power and speed that you need, plus they are a bit annoying. Youâ€™d need a hand mouse, versus the mouse pad that laptops come with and you will need to be able to view multiple monitors at once. Then to get a laptop that is super powerful, you will have to give an arm and two legs.

Overall, your trading computer should be created using the best quality brands, from the monitors you use to the graphics card that you view them with. It is recommended that you get an ATI model graphics card, such as FirePro 2460 OCle 2.0x16. The best monitors on the market happen to be made by Asus or Samsung. As you search the internet for a quality trading computer, keep in mind that there are vultures out there looking to prey on the new and unknowing, so make sure to educate yourself as much as possible before purchasing.
