If you have been using your computer for a long time now then it may be time for computer servicing. This is particularly important if you use your computer for work whether that's self employed work or in an office, but in any case just for your own sanity getting your computer to run smoothly and quickly again is a good idea.

If your computer isn't broken, then often you don't think to get computer repairs or to pay for a replacement. However that isn't to say it's necessarily working perfectly. If you bought your computer then you will know how well it can work, and it might be that only you are able to notice the small things that have changed and that aren't as smooth as they once were. Maybe it just takes an extra few minutes to load up, or maybe it's more prone to crashing. In such a situation you might find that things like loading up Word are slower too. All this can be frustrating, and more importantly it can cost you a lot of time when you are working to a deadline – and as we know, time is money.

That said though this doesn't necessarily mean that you should pay for a whole new computer which can be expensive and time consuming. Instead you should look at getting computer servicing which will mean that some of your hardware and software problems are improved quickly and without having to completely replace your machine.

There are many different things that can contribute to your computer slowing down and that can leave you needing computer servicing. The obvious culprit is spyware and malware which can get onto your computer and compromise your security and or slow your computer down by using up your available processing power. Even if you have a good firewall and virus checker, this can still be a problem and it can be difficult to rectify unless you know a lot about computers. This is particularly important to fix if it involves a security breach as you might otherwise lose important files.

You may alternatively find that your harddrive is simply wearing out. If you have a PC then this can be replaced fairly easily, though you might not be aware of how to do it yourself. It's important you do get this done though as otherwise you might find that it completely packs in as you are using it and that you lose your important files as a result. As with a car, regular computer servicing can prevent a catastrophe before the fact.

Other problems may also accumulate. You may for instance find that you have simply got too many programs running at once at start up, which can leave your computer with less memory to important tasks. You might alternatively have missing crucial system files or bad organization that can similarly cause your computer to be sluggish in its operation.

In short then there are countless niggles that can crop up for a computer over time, and if you don't get them seen to these can stop you working as well as you should or even cause bigger problems such as the loss or theft of data.
