Basic Tools Required for Collecting and Storing Blood Samples by [James](#)

Article published on February 29th 2012 | [Health](#)

With the passage of time, people have become very busy with their professional life and today, the major cause of almost every disease is the rising level of tension among them. People today suffer from different types of diseases and doctors usually prescribe several blood tests in order to find out the exact disease so that proper treatment can be meted out to the patient. With this, the demand for pathological laboratories is also increasing in leaps and bounds and several pathological laboratories are coming up everywhere. These pathological laboratories collect blood samples and examine them to measure blood lipids as well as glucose, in addition to several other tests. They either send their representatives at your home to collect the sample or you need to visit the laboratory to give blood samples..

In order to draw blood samples from patients, the laboratory assistants require needles, boxes for disposing needles, rubber gloves, dental rolls, pillow or some other form of support for the patient, adhesive dressing, disinfection swabs, and tourniquets, just to name a few. After collecting the sample, it needs to be stored for proper examination in the laboratory. For storage purpose, they require tubes for storing the blood samples, racks for keeping these tubes, boxes for transferring the tubes, freezer (if the sample needs to be kept in the refrigerator) and labels for marking the tubes.

Today, the various blood tests that are recommended by doctors have become quite affordable, except a few, and hence, it is advisable that you visit your doctor immediately in case you are not feeling well in order to understand the actual problem and get proper treatment for the same in order to get well soon.
