Article published on April 7th 2012 | Health

In a hospital, there are many types of equipment which are used while an operation and they are completely indispensable. Few among the most important equipments are the portable oxygen and oxygen concentrators. They are a life giving or one can say them as life saving equipments. These equipments contain oxygen gas, which is necessary for a patient during an operation or any serious case. Without these equipments it is humanly impossible to save any one's life and survive. These equipments hold a major importance in a hospital and are indispensable for the patients as well as the doctors.

Portable oxygen is basically an oxygen cylinder which can be moved from one place to another. They can be easily embedded in the oxygen carrying equipments used during operation. It is basically an artificial oxygen provider to the patients. As we know that that we cannot survive without oxygen, and in case of accidents or serious cases this artificial oxygen provider plays a very crucial role. One can simply say that portable oxygen is the miniature version of the oxygen concentrators. The reason why they are called portable is that they can be carried easily from one place to another without any hassles.

Oxygen concentrators are the major equipments used in the hospital. They basically provide oxygen therapy to the patients as this equipment contains oxygen gas inside it which is provided to the patient via a tube connecting the concentrator and the mask. They work on the principle of pressure absorption where the other gases like nitrogen and zeolite release the pressure and pump the oxygen to the patients through the oxygen mask. By this way the compressed oxygen is provided to the patient and is of a great help.

When we talk about the use of this concentrator, we find that the uses are extensive and these equipments are of great help to many hospitals and especially the portable oxygen is easy to carry and can be of great use while on a move. Life is indeed itself a wonder and none of us wish to lose it. But unfortunately due to mishaps many land up in the hospital and with the new techniques and extremely modified equipments the life of the patient can be positively saved and one can actually breathe the real oxygen after inhaling the compressed oxygen from the oxygen concentrators. These equipments can be purchased online these days.
