One of the oldest problems among certain females is breast asymmetry-this causes a woman to have uneven breasts, or quite simply, one of the breasts is radically larger or smaller compared with the other. Women of all ages can end up having this condition.

Generally, breasts manifest themselves throughout a girl's puberty stage, growing eventually. However, this is not what happens to 25 percent of the female population across the globe who have breast asymmetry. Studies suggest that the average weight of a breast must be 16.9 ounces, and women suffering from the condition will feel embarrassed because of their light breasts.

Also, an unequal breast is often an underlying indicator of breast cancer. According to the recent journal posted on Breast Cancer Research, women that possess asymmetrical breasts have a fifty percent likelihood of obtaining cancer of the breast. That is why it is essential for females with this problem to have physicians take a look at their asymmetrical breasts to find out if there are ailments they should watch out for. Researchers, however, observed it is common for women to have slightly different breast shapes or sizes; what's alarming is the case of close in size breasts slowly becoming asymmetrical.

Genetics

Doctors report that genetics or haphazard growth patterns in the body are a contributing factor why a number of women acquire breast asymmetry. The human breast forms because of the female hormone estrogen, expanding two years after the girl has her very first menstrual period. Over the following two to four years, the breast will continue growing right until it attains maturity. This is not the case for women who have irregular breast growths.

Cancer of the Breast

As stated by health news accounts, an asymmetrical breast size can be a symptom of impending health conditions, like breast cancer. Medical professionals usually endorse breast augmentation Los Angeles hospitals deliver to address the upshots of breast asymmetry, but self-breast checkups and regular mammogram screening ought to be done as required.

Pregnancy and Sagging

There are plenty of hormonal changes occurring in a pregnant woman's body. Her breasts become extra delicate during the entire pregnancy process. She may find that her left breast is larger compared with the other because of lactation, or the production of milk. Meanwhile, ptosis or sagging transpires when a woman starts to get older as time passes. Mature women who opted for breast augmentation procedures might also find their breasts drooping. This can be resolved by having breast implant revision done on both breasts to enhance their general physical appearance.
