# Examining Hearing, Hearing Aids, and Other Important Things About Them

by Rebecca Kavel

Article published on May 14th 2012 | Health

In everyday life, hearing plays a considerable function. The sounds of nature, the music that serves as meals for the soul, the caring words of loved ones, and the sound of an incoming carâ€”all these are meaningless to one who cannot hear. Provided these facts, one can say hearing makes communication possible.

The sad thing is, hearing can deteriorate overtime. Contrary to what many believe, loss of hearing can occur as early as mid-20's. In fact, seniors make up only one-third of the US population with hearing loss. The deaf and hard-of-hearing compose the biggest group of handicapped people in the US, totaling to close to 28 million.

Hearing loss in people is generally induced by noise pollution, earwax, age, ear infection, and medical conditions like stroke, hypertension, and diabetes. According to the Center for Hearing and Communication, sound is the greatest contributor to hearing loss as tuning in to an MP3 player at high volumes or just an everyday 15-minute exposure to a loud subway can induce permanent ear damage. If you think your sense of hearing has actually reduced the past few years, you may wish to think of undergoing hearing tests.

Hearing exams can identify the sort of hearing loss you have by determining your potential to hear sounds that reach the inner ear through the ear canal, and the sounds transmitted through the head. A lot of hearing tests will definitely call for you to reply to set of tones or words, but there are others who don't call for one. If you are detected as prone to hearing difficulties, doctors may recommend the use of hearing aids.

A hearing aid is a digital device that can make tuning in simpler for people who have hearing problems. It has 3 parts: a mic, an amplifier, and a receiver. The mic is for picking up sounds in an acoustic environment and switching them into digital signals; the amplifier selectively magnifies these signals; and the receiver changes the electronic signals back to sounds when they are delivered to the ear.

Hearing aids can be found in different styles. A couple of them are in-the-ear aids, behind-the-ear aids, receiver-in-canal aids, extended wear hearing aids, and a lot more. There are also several hearing aid brands, and they vary in cost and quality.

Sense of hearing is an immutable part of being human. Nonetheless, that does not imply that you shouldn't do anything about it. If you are detected to be vulnerable to hearing problems, it is good to acquire hearing aid services instantly. To read more about hearing aids, visit CHCHearing.org.
