Say Bye-Bye to Prominent Ear by David Shelton

Article published on February 9th 2012 | Health

Otoplasty or ear pinning is one of the few cosmetic surgery procedures available in Sydney, which can help you achieve your aesthetic goals, if you have prominent ear. Ears are definitely one feature you do not want to "stick out". For standing out just a little too much, people with protruding ears are often teased and ridiculed from a very early age. Ear pinning is more beneficial psychologically and physically when performed at a young age.

To address the degree to which the ears protrude from the side of the head, ear pinning is most commonly performed, but it can also re-sculpt and shape the ears, reduce the overall size and correct defects. In order to achieve symmetry and facial balance, normally both ears will have to be operated. The cartilage is particularly soft and malleable in children. This makes manipulation easier. The Ear cartilage is firmer in adults and due to this there are reshaping restrictions.

The patient will be put under general anesthesia during the operation and between the outer edge of the ear and the head; a small incision will be placed in the crease. When necessary, cartilage and skin will be either reshaped or removed and stitched back into place. Depending on the extent of the cosmetic surgery, the procedure will last anywhere from one to two hours.

For prominent ear, most plastic surgeons in sydney recommend parents to stay alert about their child's feelings and do not insist them on the change until they want it. Than adults, the children might find the recovery process more difficult. Sleeping positions will have to be adjusted in order to accommodate the ears, because no pressure can be applied to the area for up to two weeks. For two to three weeks afterwards, they will also be tender and sore. It is best to plan for at least three weeks off before returning to normal activities, especially in the case of children.

The good news is that there are minimal risks involved in prominent ear or otoplasty procedure and the scars of surgery are nearly invisible, although the recovery period might be daunting. Exceed minor bleeding; bruising and swelling are some of the common things to get prepared for, as all of this is common after any surgery. Hematoma has occurred in some rare cases. Since the incision is placed at the fold behind the ear, excessive scarring is uncommon. In fact, no one will even suspect that you had any plastic surgery at all, as the results are usually so subtle.

In both children and adults, Otoplasty can make huge improvements, resulting in confidence and raised esteem. It is important to educate them about the procedure and have them involved in the process, if you are considering cosmetic ear surgery for your child. Ensure that both you and your child are prepared to take the necessary time off to assist your child in the recovery process and the expectations from the outcome are realistic. The greater your chance of success in ear pinning, the more prepared you and your child is.
