Addressing Common Winter Roofing Problems in Worcester, MA by Alejamuel Sultz

Article published on May 3rd 2012 | Home Improvement

Worcester, MA experiences severe winters that lead to common roof problems. These are caused by the massive weight of snow and ice accumulation on rooftops. Homes in Worcester homes can be protected by roofs that can withstand the harsh winters in MA.

Winter roof damage typically comes from water leaks caused by ice and snow which melt due to the interior heat from the house. Water from melted ice is trapped and forms an ice dam on the roof, gutters and downspouts. This water then goes through the flashings which are not designed to endure this kind of moisture. When this happens, interior water damage or leaks occur.

Ice dams in gutters and downspouts are hard to remove without causing damage to your roofing system. Homeowners need to ensure that their gutters are regularly cleaned to reduce the risk of ice clogging and for condensed water to flow freely. In some cases, the entire gutter system may need to be removed to prevent ice damage.

While it is a normal for you or some homeowners to try to break the ice dam on the roof, this is not advisable because it can only lead to serious damage to your roofing system. Other things you should avoid include routinely removing snow from the roof, chipping away the ice dam, installing heating equipment in the attic and sprinkling salt or calcium chloride to melt the snow. Winter roofing problems are best addressed by a professional roofing contractor in the Worcester area who can assess the condition of your roof.

Worcester roofing contractors ensure that homeowners do not have to deal with problems like ice dams and attic condensation. A contractor will study the relationship of humidity and air movement in your home. He will then create a plan to target specific problems in the ventilation, flashing, insulation and underlayment which all form part of your roofing system.

Worcester roofing can be protected by preventing humid indoor air from penetrating the attic. This is done by properly insulating your atticâ€™s floor and using a dehumidifier to control water vapor. It also helps to seal all openings that allow vapor to rise into the attic, and to keep the attic temperature below freezing.

The kind of roofing Worcester MA contractors provide will guarantee that your roof is ready for the harsh winters. These contractors can repair, rebuild and install your roof for a more integrated roofing system.
