Choosing the Right Retaining Wall Design for Your Pool by [Murray Willson](#)

Article published on December 1st 2011 | [Home Improvement](#)

Home development is one among the problems of the modern age, with everyone trying to improve the value of their home with small changes. The actual fact is that even small house developments can increase your home's resale value and the more that you put into the improvement the more you are possible to get back in terms of house price increases. But, the downside to most home improvements is the price and also small projects could turn out to be pretty expensive. Even if you might have productively completed a variety of smaller tasks around the house, you may still seek yourself in difficulty when you get to a bigger project like building a concrete swimming pool. Actually digging a large enough area to suit the pool into could be something of a problem but you will also should face the complex task of fitting a retaining walls design which is able to secure the water inside the pool area.

A retaining walls design could be developed from a variety of different materials, including fitting slabs of concrete, or poured concrete, along the sides of the hole you could have dug. Many people like to put in a concrete swimming pool since it will be not too complicated to suit into an area and could be done easily by a professional. The only downside is that some people find that their retaining walls style for the pool begins to fail after some years of use and this may be pretty costly to remove. Another downside is that concrete walls usually look rather minimalist and may be unattractive, which leads several people to choose different forms of retaining walls so as to get a good look for their swimming pool.

Another popular type of retaining wall is that of the timber frame. These may simply be made by even an amateur fitter, and they need an attractive and sophisticated look that the concrete swimming pool lacks. The timber can be rather awkward to shift for those who are not used to it since it often is cut to large dimensions. The timber frame could even start showing signs of degradation sooner than different forms of retaining wall.

If you would sort of a natural look, then you might select to use boulders for your retaining wall. These are effective because of their weight, and could be built using a sloping style so as to avoid caving. But, boulders could be rather expensive, depending upon the provider, and can want checking regularly to make sure that they are still working well.
