Driveway Interlocking - the most durable paving solution for your home!

by Eric Wood

Article published on June 19th 2012 | Home Improvement

While there are other paving choices besides interlocking pavers, to be sure, interlocking pavers are the best choice when it comes to obtaining the most durable paving solution for your home. In fact, you should really know that, at least today, there is simply no other kind of product in use that has the ability to either stand out or stand up the way that interlocking pavers can!

What said interlocking pavers do is that they offer homeowners a very attractive curb appeal in the front of their homes and even both elegance and charm around the residence? These areas of oneâ€™s residence might well be instead left unattractive and even dull thanks to inferior rivals such as asphalt and concrete. It goes without saying that there are a ton of advantages to choosing interlocking pavers over other options. Let us have a quick look at the benefits of these interlocking pavers over other options.Besides interlocking pavers and driveway interlocking, you could also get gravel, brick, concrete and asphalt paving options. However, these four alternatives are nowhere near as good as interlocking pavers, as you will soon see in this comparison of paving materials.

For starters, interlocking pavers come with high durability, which is more than what can be said about the other four options.You see, concrete can crack and even shrink over time; asphalt can also crack and get softer over time; brick can simply chip off after a period of time; and gravel is not a permanent material, totally disqualifying it as a material that is suitable for paving in the first place.

Second of all, interlocking pavers are easy to repair when compared with the other four materials. You see, if one of the stones in the interlocking pavers gets damaged, you just remove the damaged stone and replace itâ€”it is that simple! With concrete, for instance, the costs for repair are quite high if a section of it is damaged or cracked. Asphalt is also expensive to fix if it stains or gets damaged, and brick is no picnic either to replace because of the utilization of mortar. Finally, gravel requires filling in on a regular basis, and this tends to lead to it getting uneven over a period of time.

Another benefit to utilizing interlocking pavers is that the maintenance required is relatively low compared to some of the other paving materials. For example, they are easy to clean and wear well. On the other hand, stains on concrete are quite hard to remove; stains on asphalt require power washing or at least hosing down; stains on brick also need to be power washed or hosed down; and gravel obviously demands that the homeowner keeps filling in the gravel on a routine basis, which will get tiresome after a short while.

As you can easily see, there is hardly a comparison between driveway interlocking and some of the other options for paving materials. In fact, it is clear that driveway interlocking is highly superior to the other alternatives in so many different aspects. At the end of the day, interlocking pavers look nicer, but they also require less maintenance and do not succumb as easily to damage and stains.
