Guidelines in Picking Designer Fire Pit by Joy Shiela

Article published on January 25th 2012 | Home Improvement

A lot of homes nowadays are already equipped with a designer fire pit as a centerpiece on family gatherings during weekends or when one simply desires to have a cozy evening at home. When you have a table fire pit, it seems like you have your very own bonfire in a camp minus the hard grounds. The fire is lighted in a powerful fire bowl placed at the center of the elevated table. These tables are commonly made of wrought iron stands, copper or aluminum while some are made of solid wood. These fire pits will go perfectly on open gardens and inside the living room or kitchen and can be used in cozy restaurants as an additional attraction.

For you to get the very best custom fire pits in town, consider the following tips:

> Pick a table with a huge fire bowl as it allows continued burning of logs and it is also easier to light the logs. With large bowls, more logs can be put in which suggests logs will burn longer and less monitoring is needed.

> Pick a fire pit table with a fire bowl that has a cover so it stays protected when not in use. Because of this, you can use your table the same old way if you don't want to have a cozy fire in your place.

> If you want to have a more reliable table, pick one that is brief and closer to the ground. But, low tables can possibly scorch the ground with continued burning. To stop this, place a heatproof pad under the table.

> To keep your pets and children away from harm, remember to get a designer fire pit with spark screen. Some fire pit tables are equipped with spark screen but if you purchased one without it, you can just but one as an added accessory. If you are going to purchase a spark screen, choose one that can be easily removed or replaced and one that can be easily opened when you have to add more logs.

> If you are likely to place your fire pit table in your garden or anywhere uncovered, purchase an additional rain cover for it. But if you live in a dry area or if you intend to place the table indoors, there is no longer a need for you to buy this accessory. A rain cover will keep your fire bowl dry and at the same time, protect your logs from getting wet to allow them to still be used the next time you need fire on your table. Soggy ashes will speed up the corrosion of the material of your fire bowl so it is very important keep it dry.
