Is the vinyl siding considered an environmental friendly option? by [Caldwell](#)

Article published on February 24th 2012 | [Home Improvement](#)

The answer is "yes", as any vinyl siding CT installation contractor can tell you, there are several aspects that recommend vinyl as a superior green material by comparison to the other siding materials. At the same time, vinyl looks exquisite and the simple fact that it is a green alternative does not entail that homeowners will settle for less than the very best.

However, the following article will analyze vinyl strictly from the perspective of environmental safety and list a few of its contributions to a greener, healthier tomorrow. On a side note, an indicator regarding the green nature of this material siding is that the government is willing to offer tax credits to homeowners who switch to vinyl sidings of up to \$1,500.

First and foremost, the process through which the vinyl is manufactured is environmentally friendly and produces negligible quantities of waste material. In other words, before the vinyl siding CT contractor has installed it, vinyl has already taken the first step to a greener tomorrow. But the other great thing about it is that even the installation process presents the same benefits as the manufacturing. By comparison to other siding fabrics, there is virtually no eco-friendlier material and this is only the tip of the iceberg.

A further benefit of vinyl is that it is extremely light. It may not seem like much until you remember that the amount of fuel used for transporting the construction materials from the production center to the deposit of the vinyl siding CT contractors and later on, to the residence of the customer is directly proportional to the weight of the load. Therefore, the lightweight nature of vinyl entails that each individual vehicle will use less fuel, produce less exhaust and also that more vinyl can be transported in a single run. If you take into account the shortage of combustibles predicted in the next thirty years, the innate lightweight nature suddenly becomes of critical importance.

But although it is light, that does not mean it is not durable. In fact, vinyl sidings can be regarded as eco-friendly due to the fact that they require a limited amount of cleaning or maintenance, which entails that lower quantities of industrial solvents, paint or sealing agents which are very harmful for the environment need to be used. In addition, the durability of vinyl implies that the siding can be changed less often, which is again beneficial.

Lastly, homeowners need to know that vinyl sidings include decent insulating properties. Therefore, the vinyl sidings are capable of maintaining the temperature of the house constant without an excessive energy consumption. The less energy is required for heating and cooling the home, the more environmentally friendly your household is. Overall, when it comes to choosing the new material for sidings and you want to make sure that you are doing your fair share in building a better future for the planet and your children, vinyl is the way to go. Inexpensive, eco-friendly and reliable – vinyl sidings constitute one of the primary types of siding materials.
