Material Choices for a Better Roofing and Improved Protection by [Gabrielle Jeromy](#)

Article published on June 6th 2012 | [Home Improvement](#)

Whether it is because of time, weather, faulty installation, or poor maintenance, the time will come when you finally need to have your roof replaced. Repairs can get rid of roof problems, but every roof will eventually reach the end of its lifespan. A roof is designed to endure rains, winds, snow, heat, and many other elements. However, this does not mean that it can last forever.

When you need to have your roof replaced, the first thing you should do is to find a reliable roofing company or contractor. Delaying replacement can leave your home exposed to the weather, and this can bring about more damage. Since this is your home's protection on the line, you have to make sure that you hire the best.

Once you have decided on a roofing company, one of your next concerns is choosing a roofing material that best suits your home. There are several materials that you can choose from, and each of them has its own benefits. Listed below are some of the roofing materials commonly used by New Jersey homeowners.

Metal. Metal is one of the most popular roofing materials these days. It's lightweight and easy to install, but boasts excellent durability. Metal roofing can last for up to 40 years or more. Another benefit of metal roofing is that it requires very little maintenance. It also comes in various colors and designs, giving homeowners more choices. Metal roofing can also make your home more energy efficient, since it can deflect heat better than other types of roofing.

Asphalt shingles. This roofing material is offered by most New Jersey roofing contractors. Asphalt shingles are made of fiberglass mats or rag mats that are covered with mineral granules. There are different grades of these shingles, ranging from a life expectancy of 15 to 30 years. The good thing about this material is that it has low installation costs; when a single shingle gets damaged, it can easily be replaced. Asphalt shingles also come in different colors.

Slate. When a roofing contractor New Jersey has suggests slate, expect it to be more expensive, but with a good reason; it is durable while being low maintenance. It is said to last over a hundred years, even with very little maintenance. Slate roofing is limited to shades of red, black and grey.

These are just a few of the durable materials that you can acquire from NJ roofing contractors. These contractors will help you select which material is best for your home to make sure your roof replacement provides you with better protection.
