Planning an All-Encompassing Fail-Proof Security System for Home by Nathan Brown T

Article published on March 17th 2012 | Home Improvement

Security is often jeopardized by the most obvious source. Whether it is your personal security or your homeâ€™s security, you should expect someone to breach it at some point of time or the other. So how do you protect yourself? Plan one ahead, and expect the unexpected. The key to planning a sound security for your home is, perceiving the various possibilities even before they have happened. The principal security concerns that plague homes are: human invasion, flood, fire, threats from wild animals...etc. ADT Security Systems can give you protection from fire, flood and invasion, and are extensively used in homes across the US. Incorporate one of the alarm systems and you will have bought peace of mind not only upon yourself but for your family as well.

Flood is one of the major natural threats to homes across the US. If you live near water streams or close to a river, taking precautionary steps can be really daunting. But if you are building a house from scratch, raising the landscape to at least 5 or more feet above the mean street level can give some sense of security although that does not guarantee total protection. Instead of keeping your house to a single floor, try building an extra so that you will have a safe place to stay until help arrives. Another thing that you can plan is a drainage system. Even fitting a flood warning system can help you immensely. They may not protect your home, but they will forewarn you at least a few hours ahead of an impending disaster. The lead time you get to make an exit is very crucial and that donâ€™t forget.

Incidences of fires in homes have risen dramatically, and the most like places where they originate are the kitchen, basement and the garage. Electrically operated equipments are the most likely candidates that can ignite a fire, and human lethargy is often the cause for poorly maintained equipments. Include a routine inspection for electrical equipments in your plan for wiring and insulation and you will feel that much safer. It also makes sense to replace aging wires and cables periodically and use the right quality of materials commensurate with your usage. Leaving kitchen equipments unattended when in use is another cause for fires in homes. Your kitchen equipments may be fully automatic, but that doesnâ€™t mean they donâ€™t need attention while being used. A fire ala can be really helpful; they will give you all the time you want to prevent a major fire from engulfing your home, and possibly the whole neighborhood.

At least a third of all homes in the US are susceptible to burglary. Hundreds of homeowners lose millions of dollars to burglars, and the important point to note is that they are preventable. Burglar alarms in homes are reason enough for petty burglars to desist from attempting a break in. The very thought of an alarm going off is anathema to most of them. Like all security equipments, fire alarms too only forewarn homeowners and donâ€™t prevent one from happening. To keep yourself safe from burglary you will have to do more than simply ordering and fixing equipments. Like for example, you can ask your neighbor to help remove news paper lying in front of your home when you are away on a vacation, leave a lamp switched on during nights, keep the pathway clear of shrubs and tall growths, secure your garage by keeping it locked, ensure that the windows are closed after dark and that you have the right kind of dead bolts fixed on the front door.
