Wall Fountains for Offices by Andersonlara

Article published on December 27th 2011 | Home Improvement

A wall fountain is a wonderful method of creating an elegant, relaxing and soothing atmosphere for one's office space. There are plenty of professional office settings that would benefit from the placement of a wall fountain in a room. These fountains vary in design, but they all feature the ability to allow water to flow into a reservoir. The water that flows into the reservoir is recycled, so having a wall fountain not only is soothing and lovely to look at, but these are made with environmentally responsible features.

These fountains vary in size and style. They can be small in scale, or they can be are tall as a person standing next to a wall. They are made from stone, rocks, marble, copper, or tin. The design of a fountain that gets placed in an office depends upon the type of office space it will be placed in, as well as the decor of the room.

For example, there are wall fountain styles that are created to look like square or rectangular portraits. These models might have an illuminating backdrop. These types of fountains are usually framed with wood as well. The water will drip in between the frames, in between glass. These are best to hang up in business offices. While they are interesting to look at, they aren't distracting.

There are wall fountains that are a lot more intricate. For example, there are fountains that feature waterspouts, so that the water can fall from the spout into a pool. The water is recycled through a pump that is located in the pool, and behind the spout. There are models that feature multiple spigots. There are also wall fountain models that feature one large spout. These models look like ornate works of art that one would expect to find outdoors. These are best for upscale offices that offer relaxation services, such as health and beauty spas.

Something to keep in mind with regards to installing and caring for a wall fountain, is that the more intricate and ornate these are, the more important that it is for these fountains to be installed by a professional contractor. This is especially true for the wall fountain models that feature spouts of water dripping down into a pool. One might even have to consult with a professional plumber, in order to make sure that the water line is flowing to the fountain correctly. Otherwise, if the water line isn't flowing and being released through the fountain correctly, water can cause structural damage to the walls. This in turn will cause mold damage in the walls of the office.

A wall fountain has to be handled with care. They are made out of delicate materials, so one needs to make sure that they are handling fragile components with care. Finally, one must make sure that the water that collects in the water wall fountain is refreshed. The water will recycle itself, but it needs to be refreshed so that organisms don't collect in the water.

With proper installation and care, a wall fountain can make the appearance and the atmosphere of an office feel very inviting.
