Bonded DSL Internet Service Increases Your Broadband Speed by DANA BATES

Article published on May 12th 2012 | Internet

Be it your home or office computer, you would certainly want to increase your broadband speed. Most people often link higher speeds to higher costs, but that need not be true all the time. Yes, there are plenty of services provided by various service providers that offer you higher broadband speeds â€“ both upload and download, but charge you a whopping sum. Therefore, instead of opting for those expensive internet plans you could go ahead and get yourself or your business Bonded DSL internet.

What is DSL bonding and how it helps increase broadband speed

The process of DSL bonding is very simple to understand as well as implement and this makes it one of the best solutions to faster internet connections. Just as the name suggests Bonded DSL basically involves the aggregation of two or more internet connections either from the same service provider or different providers and thatâ€™s up to you to decide.

To successfully accomplish DSL bonding you would first need to aggregate the connections using an internet load balancing router that is capable of running bonding functions. Bonded DSL connections can reach speeds of around 48 Mbps for home as well as office connections and the speed can be increased further for large businesses as more and more lines are linked together.

There are various ways to successfully bond two lines and the common method employed is packet level bonding. When it comes to packet level bonding thereâ€™s hardware installed such that the data is distributed amongst all the lines in the connection and therefore the load on each line is reduced drastically and hence you could perform more tasks and this helps increase your download speed.

Another advantage of using Bonded DSL is the choice of using two or more services. If you need 100% uptime it would be advisable to use the services of more than just a single provider as inevitably there are times when the connection of your service provider will go down.The data packets will all be transferred to the other connection in this case.

Therefore, if at all youâ€™ve got a DSL connection or are planning on shifting over, it would be better if you manage to get a connection from different service providers. Bonded internet connections are easy to install, cheap and at the same time give you higher internet speeds. Therefore, plenty of businesses as well as homes are turning over to bonded internet services.
