Various types of internet connections by [Peter D](#)

Article published on May 10th 2012 | [Internet](#)

Internet is one such service that almost all individuals and businesses need today. It has become one of the most crucial services required for day-to-day operations. Almost every individual or a business is highly dependent on internet services today. The importance of this service has grown since it first came into existence and has been on the rise ever since. There are a number of factors that determine the quality of internet connection and among them choosing a reputed internet service provider is right at the top. As internet services have grown in the last few years, the cost of taking internet services have come down drastically.

Initially telephone lines were used to access the internet. This service is however not so popular anymore mainly because of connectivity issues. The speed on this connection gets immensely affected when the distance of the service provider increases. Telephone lines have now been replaced by cable lines and this known as cable broadband Internet. In this connection coaxial cables are used to transfer data from the service provider to the computer. The third kind of Internet service that is available is called a fiber optic broadband Internet. The speed on this connection is said to be much higher in comparison to other two connections. Another service that has gained a lot of popularity is an Internet Leased Line. This connection is said to be the most suited for organizations. So let us discuss in detail about why it is useful for businesses to go for them.

An Internet Leased Line is a 24-hour constant service which is dedicated to provide a structure that will make sure that you are able to connect fast and directly to Internet. Companies that offer internet services through a Leased Line usually charge a yearly rental to its subscribers. There is no connection or any other other connectivity charges for the use of this service. In order to use a Leased Line for providing internet services the service provider needs to install a separate router or a hub that offers direct Internet access. These lines are most suited for businesses that need dedicated and uninterrupted internet services throughout the day.

Leased Lines services are now easily available in all leading cities of India, including Delhi, Mumbai, and Chennai among others. If you are among the people who are seeking to take this dedicated solution, the user is first advised to review his requirements.
