Stunning nails via nail drill by Roger Lopez

Article published on January 24th 2012 | Jewelry

A lot effort goes into preparing the nails to achieve that wonderful nail art which is envy for any woman. Simply put, nail art is dazzling and stunning. One of the most important is the filing process. In order that the nails are not damaged and are accurately filed, the service of an experienced nail technician could be counted on. If one is good enough with the process of using a simple electric file or nail drill, she can actually consider filing her nails alone. Hand filing is another choice but the result it produces will not be as the one you get through professional hand as when a nail drill with the correct bits can get.

Nail drill is actually an electric nail filer that is used for shortening, buffing, cleaning, filing and backfilling of nails. Not only its results are amazing, it saves nail technicians enough time. The cuticle and sidewalls which are areas that are hard to reach are easily taken care of using the right nail drill bit.

Through the process, acrylic and UV gel nails are easily filed unlike a hand filer that is difficult to shape these artificial nails. For beginners, sand bands are recommended. It will give you good practice for cleaning nail surface and pedicures after they are slipped over a mandrel. The sole limitation it has is that it can be used once and cannot be disinfected.

Soft drill bits are favorable for the natural nail plate and are available in the barrel, bullet and cone varieties. There are ranges and different materials of drill bits for acrylic nails. Carbide bits are of very high quality and are regarded as the best in the industry. Technicians do not have to apply much pressure on the clientâ€™s nail. Accordingly, friction is reduced decreasing the heat and prevents the nail from damage and burns. For shortening, refining C curves and surface work, the large barrel golden carbides are good.

One must carry out basic research before actually investing in a nail drill or nail drill bits. It is advisable that one start investing in a basic drill set and then slowly climb up the higher levels when confidence develops. Besides, keep in mind if you are an actual pro or a rookie and the amount you are willing to spend on the drill. Also, nail drill bit should be replaced periodically to ensure sharper and better result and enough care and attention be paid less you damage your nail or that of your client.

Technicians will also ensure it is hygienic by sanitizing each bit before using it on a new client. If you want to walk out of a nail salon with magnificently looking nails, see that a nail drill is used by the technician with the appropriate bits.

Lastly, just for the sake of knowledge UV Gels can make oneâ€™s natural nails more durable and stronger, and their high gloss beauty are considered un-matched. Though, they do not last much longer than the acrylic nails and need to be maintained more often. These Gel nails often come in a large selection of brand names, types and styles.
