Article published on February 15th 2012 | Management

Storage of data is vital for any firm and a database becomes inevitable. Generally the things are manipulated by a database management system software or DBMS software. The DBMS software needs to be managed and maintained and this is called database administration. The process of management and maintenance is mainly of three types. They are system DBAs which focus on the extensive aspects, development DBAs focussing on the development and logical aspects and finally the application DBAs mainly used in organisations that have purchased application software from third party.

Those who use the DBMS software pay great attention in IT staffing so as to get the skilled staff capable to manage the software, the database administrators. As far as the oracle implementation is concerened it is a risky and challenging process with a lot of unforeseen problems in the way. So, relying on the experts who are specialised in the same regard will only do the favor. They very well know the art of meeting the deadlines within genuine budget.

Maximum utilization of available resources is a tactic and only those who master this tactic can survive in this industry of stiff competition. Augumenting resources are one of the tactics an IT firm chooses to remain competative financially. Hiring the employees for a finite time will avail flexibility to the employers in regard of project scope. Long term commitments to the employees many times turn out to be an extra burden as over extension of obligation never seems professional in certain situations.

IT resource augmentation actually is contracting. The IT firms hire the employees on the basis of a contract which is usually based on project length and type of help needed. This is the most ideal option for a company when the intension is to get an extra assistance or expertise without having to make any sort of everlasting commitments to anyone.
