The Need for Used HPLC by James Blee

Article published on May 1st 2012 | Management

HPLC is a common analytical technique which plays pivotal role in forensic sciences ranging from toxicology to environmental analysis. HPLC equipment has varied uses and hence it is not always possible to buy a new one. Used hplc equipment is ideal to meet the short term project needs where the equipment is no longer required once the project is finished. Low in cost this equipment is cheaper when bought second hand rather than on lease. Second hand equipment can even be kept as a back up in order to keep the work going on in case the new equipment fails.

Moreover, buying used equipment even provides you with the assurance regarding its working. In some cases, you might need to replace some parts which would not prove to be an expensive affair as compared to the replacement of parts in new equipment. As a pump motor in HPLC lasts for years, it is easy to replace it. Moreover, this pump is even readily available..

Used equipment is also easy to operate and do not cause any hindrance as it has been used several times before as well. The equipments are also tested for their quality and performance before they are sold hence they are in a good working order. Second hand HPLC can even be delivered and installed by the manufacturer. The range of this HPLC is also extensive and you can choose one as per your needs and budgetary constraints. Moreover, their spare parts are easy to obtain as they have been in use since quite some time in comparison to the newer models launched.

New equipment undoubtedly provides a better performance but a used one is cost effective and can meet your instant needs of the hour. High in quality and easy to obtain this second hand equipment is widely used in laboratories for conducting different researches.
